## ABSTRACT OF THE DISCLOSURE

In an apparatus for filtering and separating fluids, including a pressure-tight housing having a fluid injet, a retentate outset and a permeate outset, a plurarity of stacks of memorane filter elements are arranged in the housing adjacent one another and joined such that the fluid is conducted through the stacks of membrane filter element in a series flow pattern and each stack includes a plurality of spaced membrane pillows arranged in spaced relationship such that the fluid is conducted in a meanuer-like pattern through the stack.
